## 1 Introduction

The PX200 is a high-power low-noise amplifier designed to drive unlimited capacitive loads from DC to 100 kHz . The output voltage range is user-selectable from $\pm 50 \mathrm{~V}$ to +200 V which provides a high degree of application flexibility. In particular, two amplifiers can be connected in bridge-mode to provide $\pm 200 \mathrm{~V}$ with 280 Watts of power. The amplifier will deliver up to 4 Amps peak for sinusoidal operation, or up to 8 Amps for pulse applications

The amplifier is compact, light-weight, and can be powered from any mains supply. The output connectors include LEMO 00, LEMO OB, and 4mm Banana Jacks so many commercially available piezoelectric actuators can be directly connected. The PX200 is suited to a wide range of applications including: electro-optics, ultrasonics, vibration control, nanopositioning systems, and piezoelectric motors.

## 2 Warnings / Notes

This device produces hazardous potentials and should be used by suitably qualified personnel under the supervision of an observer with appropriate first-aid training. Do not operate the device when there are exposed conductors.

High-Voltage

## 3 Specifications

| Electrical |  |
| :---: | :---: |
| Output Voltage Ranges | +50 V to $+200 \mathrm{~V}, \pm 100 \mathrm{~V},-50 \mathrm{~V}$ to +150 V |
| RMS Current | 1.5 Amps (3 Amps in 100V range) |
| Peak Current | $2 \mathrm{Amps}, 4 \mathrm{Amps}$, or 8 Amps |
| Gain | $20 \mathrm{~V} / \mathrm{V}$ |
| Slew Rate | $35 \mathrm{~V} / \mathrm{us}$ |
| Signal Bandwidth | 390 kHz |
| Power Bandwidth | 55 kHz (200 Vp-p sine-wave) |
| Max Power | 140 W Dissipation |
| Offset | OV to Full Range with front panel adjustment |
| Load | Stable with any load |
| Noise | 270 uV RMS (10uF Load, 0.03 Hz to 1 MHz ) |
| Overload | Thermal and over-current protection |
| Analog Outputs | Voltage monitor $1 / 20 \mathrm{~V} / \mathrm{V}$ (BNC) Current monitor $1 \mathrm{~V} / \mathrm{A}$ (BNC) |
| Analog Input | Signal input (BNC, $Z_{\text {in }}=27 \mathrm{k}$ ) |
| Output Connectors | LEMO OB and LEMO 00 Sockets 4mm Banana Sockets |
| Power Supply | 90 Vac to 250 Vac |

|  | Mechanical |

| Environment | 0 to $40^{\circ} \mathrm{C}\left(32\right.$ to $\left.104^{\circ} \mathrm{F}\right)$ <br>  <br>  <br> Non-condensing humidity |
| Dimensions | $212 \times 304.8 \times 88 \mathrm{~mm}(8.35 \times 12 \times 3.46 \mathrm{in})$ |
| Weight | $2 \mathrm{~kg}(4.4 \mathrm{lb})$ |

## 4 Output Voltage Range

The desired voltage range should be identified when ordering. The following voltage ranges can be obtained with the correct combination of installed jumpers. Note that incorrect jumper settings may damage the amplifier.

The standard output voltage range is 0 V to 200 V . However, the amplifier can be supplied with any of the following voltage ranges by appending the order code with the voltage range code; for example, the standard configuration is PX200-V200. The voltage range jumper locations are labelled LK1 to LK8 on the PCB. Only three jumpers should be installed at any time.

| Voltage Range | RMS Current | Code | +Supply | GND | -Supply |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{O V}$ to $\mathbf{+ 2 0 0}$ | 1.5 A | -V 200 | LK1 | LK8 | LK7 |
| $\mathbf{0 V}$ to $\mathbf{+ 1 5 0}$ | 1.5 A | -V 150 | LK2 | LK8 | LK7 |
| $\mathbf{- 5 0}$ to $\mathbf{+ 1 0 0}$ | 1.5 A | $-\mathrm{V} 50,100$ | LK1 | LK3 | LK6 |
| $\mathbf{- 5 0}$ to $\mathbf{+ 1 5 0}$ | 1.5 A | $-\mathrm{V} 50,150$ | LK1 | LK5 | LK7 |
| $\mathbf{- 1 0 0}$ to $\mathbf{+ 1 0 0}$ | 1.5 A | $-\mathrm{V} 100,100$ | LK1 | LK3 | LK7 |

Table 1. 200 Volt Range Configurations
In addition to the 200 V ranges described above, three 100 V ranges are also possible. These ranges have the benefit of twice the peak and RMS current, which enables higher frequency operation when driving low-voltage actuators.

| Voltage Range | RMS Current | Code | +Supply | GND | -Supply |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathbf{0 V}$ to $\mathbf{+ 1 0 0}$ | 3.0 A | -V100 | LK1 | LK3 | LK4 |
| $\mathbf{0 V}$ to $\mathbf{+ 5 0}$ | 3.0 A | - -V50 | LK2 | LK3 | LK4 |
| $\mathbf{- 5 0}$ to $\mathbf{+ 5 0}$ | 3.0 A | $-\mathrm{V} 50,50$ | LK2 | LK3 | LK6 |

Table 2. 100 Volt Range Configurations

The jumper settings can be modified by disconnecting the amplifier from mains power then removing the top panel to access the PCB board.

## 5 Output Current (200V Range)

In the 200 V ranges, the standard output current is $\pm 2$ Amps peak and 1.5 Amps RMS. This peak current is matched to the average current limit so that a sine-wave can be reproduced continuously at full current. However, for applications that require fast step changes in voltage, the amplifier can be configured in a pulse mode with 4 Amps or 8 Amps peak current limit. The maximum pulse time for each mode is listed in Table 3 and plotted against current in Figure 1.

The output current range can be configured by disconnecting the amplifier from mains power then removing the top panel. The following modes can them be obtained. The amplifier can be supplied preconfigured to any current range by appending the order code with the current range code, for example, the standard configuration is PX200-C2.

| Peak Current | Code | Peak Limit | LK17 | Overload Timer | Max Pulse Time |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 2 A | -C2 | LK11 | "B" Position | LK16 and LK18 Out | 1 ms |
| 4 A | -C4 | LK12 | "B" Position | LK16 and LK18 In | 200 us |
| 8 A | -C8 | LK13 | "B" Position | LK16 and LK18 In | 100 us |

Table 3. Current limit configuration in 200V range (Standard)

Figure 1. Maximum pulse time versus current

## 6 Output Current (100V Range)

In the 100 V ranges, the output current can be doubled to $\pm 4$ Amps peak and 3 Amps RMS. For applications that require fast step changes in voltage, the amplifier can also be configured in a pulse mode with 8 Amps peak. The maximum pulse time is identical to the 200 V range discussed above.

The output current range can be configured by disconnecting the amplifier from mains power then removing the top panel. The following modes can them be obtained. The amplifier can be supplied preconfigured to any current range by appending the order code with the current range code, for example, the 100 V range and 4A current limit is PX200-V100-C4B.

| Peak Current | Code | Peak Limit | LK17 | Overload Timer | Max Pulse Time |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 4 A | -C4B | LK12 | "A" Position | LK16 and LK18 Out | 1 ms |
| 8 A | -C8B | LK13 | "A" Position | LK16 and LK18 In | 100 us |

Table 4. Current limit configuration in 100 V range

## 7 Power Bandwidth

With a capacitive load, the peak load current for a sine-wave is

$$
I_{p k}= \pm V_{p p} \pi C f
$$

where $V_{p p}$ is the peak-to-peak output voltage, $C$ is the load capacitance and $f$ is the frequency. Given a peak current limit $I_{p k}$, the maximum frequency is therefore $f=I_{p k} / V_{p p} \pi C$. However, the PX200 is protected by both peak and average current limits. The average current $I_{a v+}$ is defined as the average positive or negative current. For example, for a sine-wave

$$
I_{a v+}=\frac{1}{2 \pi} \int_{0}^{\pi} I_{p k} \sin (\theta) d \theta=\frac{I_{p k}}{2 \pi}[-\cos ]_{0}^{\pi}=\frac{I_{p k}}{\pi} .
$$

Therefore, for a sine-wave $I_{a v+}=I_{p k} / \pi$. Since the average current limit is $I_{a v+}=0.7$ in the 200V range, the maximum frequency sine-wave, or power bandwidth of the PX200, is equal to

$$
f=\frac{0.7}{V_{p p} C},
$$

The above result is true for any periodic waveform such as triangular signals. In the 100 V range, the power bandwidth is doubled. The RMS current for a sine-wave can also be related to the average current,

$$
I_{a v}=\frac{\sqrt{2}}{\pi} I_{r m s} .
$$

The power bandwidths for a range of load capacitance values are listed below.

| Load | Peak to Peak Voltage (200V Range) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Cap. | 200 | 150 | 100 | 50 |
| 10 nF | 55 kHz | 74 kHz | 100 kHz | 100 kHz |
| 30 nF | 55 kHz | 74 kHz | 100 kHz | 100 kHz |
| 100 nF | 35 kHz | 46 kHz | 70 kHz | 100 kHz |
| 300 nF | 11 kHz | 15 kHz | 23 kHz | 46 kHz |
| 1 uF | 3.5 kHz | 4.6 kHz | 7.0 kHz | 14 kHz |
| 3 uF | 1.1 kHz | 1.5 kHz | 2.3 kHz | 4.6 kHz |
| 10 uF | 350 Hz | 466 Hz | 700 Hz | 1.4 kHz |
| 30 uF | 116 Hz | 155 Hz | 233 Hz | 466 Hz |

Table 5. Power Bandwidth versus Load Capacitance (200V Range)

| Load | Peak to Peak Voltage (100V Range) |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 100 | 75 | 50 | 25 |
|  | 100 kHz | 100 kHz | 100 kHz | 100 kHz |
|  | 100 kHz | 100 kHz | 100 kHz | 100 kHz |
| $\mathbf{1 0 0} \mathbf{~ n F}$ | 100 kHz | 100 kHz | 100 kHz | 100 kHz |
| $\mathbf{3 0 0} \mathbf{~ n F}$ | 46 kHz | 62 kHz | 93 kHz | 100 kHz |
| $\mathbf{1 ~ u F}$ | 14 kHz | 18 kHz | 28 kHz | 56 kHz |
| $\mathbf{3} \mathbf{u F}$ | 4.6 kHz | 6.2 kHz | 9.3 kHz | 18 kHz |
| $\mathbf{1 0} \mathbf{u F}$ | 1.4 kHz | 1.8 kHz | 2.8 kHz | 5.6 kHz |
| $\mathbf{3 0} \mathbf{u F}$ | 466 Hz | 622 Hz | 933 Hz | 1.8 kHz |

Table 6. Power Bandwidth versus Load Capacitance (100V Range)

In the above tables, the frequencies limited by slew-rate are marked in green while the frequencies limited by signal bandwidth are marked in blue. The slew-rate is approximately $35 \mathrm{~V} / \mathrm{US}$ which implies a maximum frequency of

$$
f^{\max }=\frac{35 \times 10^{6}}{\pi V_{p p}}
$$

In the following figures, the maximum frequency periodic signal in the 200 V and 100 V range is plotted against the peak-to-peak voltage.

Figure 2. Power bandwidth versus voltage and load capacitance (200V Range)

Figure 3. Power bandwidth versus voltage and load capacitance (100V Range)

## 8 Small Signal Bandwidth

Figure 4. Small signal frequency response.

| Load Cap. | Bandwidth |
| :---: | :---: |
| 10 nF | 393 kHz |
| 30 nF | 431 kHz |
| 100 nF | 367 kHz |
| 300 nF | 208 kHz |
| 1 uF | 88 kHz |
| 3 uF | 30 kHz |
| 10 uF | 9.3 kHz |
| 30 uF | 3.7 kHz |
| 110 uF | 1.3 kHz |

Figure 5. Small signal bandwidth versus load capacitance (-3dB)

## 9 Noise

The output noise contains a low frequency component ( 0.03 Hz to 20 Hz ) that is independent of the load capacitance; and a high frequency ( 20 Hz to 1 MHz ) component that is inversely related to the load capacitance. Many manufacturers quote only the AC noise measured by a multimeter ( 20 Hz to 100 kHz ) which is usually a gross underestimate.

The noise is measured with an SR560 low-noise amplifier (Gain = 1000), oscilloscope, and Agilent 34461A Voltmeter. The low-frequency noise is plotted in Figure 6. The RMS value is 173 uV with a peak-to-peak voltage of 960 uV .

Figure 6. Low frequency noise from 0.03 Hz to 20 Hz . The RMS value is 173 uV , or $960 \mathrm{uVp}-\mathrm{p}$.
The high frequency noise ( 20 Hz to 1 MHz ) is listed in the table below versus load capacitance. The total noise from 0.03 Hz to 1 MHz is found by summing the RMS values, that is $\sigma=\sqrt{\sigma_{L F}^{2}+\sigma_{H F}^{2}}$.

| Load Cap. | Bandwidth | HF Noise RMS | Total Noise RMS |
| :---: | :---: | :---: | :---: |
| $\mathbf{1 0} \mathbf{~ n F}$ | 393 kHz | 379 uV | 417 uV |
| $\mathbf{3 0} \mathbf{~ n F}$ | 431 kHz | 382 uV | 419 uV |
| $\mathbf{1 0 0} \mathbf{~ n F}$ | 367 kHz | 382 uV | 419 uV |
| $\mathbf{3 0 0} \mathbf{~ n F}$ | 208 kHz | 326 uV | 369 uV |
| $\mathbf{1 ~ u F}$ | 88 kHz | 234 uV | 291 uV |
| $\mathbf{3 ~ u F}$ | 30 kHz | 214 uV | 275 uV |
| $\mathbf{1 0} \mathbf{~ u F}$ | 9.3 kHz | 198 uV | 263 uV |
| $\mathbf{3 0} \mathbf{~ u F}$ | 3.7 kHz | 187 uV | 255 uV |
| $\mathbf{1 1 0} \mathbf{u F}$ | 1.3 kHz | 183 uV | 252 uV |

Table 7. RMS noise versus load capacitance ( 0.03 Hz to 1 MHz )

## 10 Input and Offset Configuration

The input stage is a differential amplifier with an input impedance of 27 k . The input signal ground is permitted to float by up to 0.6 V before it is clamped to the system ground.

The input stage is normally non-inverting; however, it can be configured as inverting by changing LK9 and LK10 to their " $B$ " position. The default jumper position is " $A$ " which is marked with a white bar on PCB overlay. The amplifier can be supplied with an inverting input by appending the order code with -INV.

| Input Configuration | Code | Link Positions |
| :---: | :--- | :--- |
| Non-inverting (default) |  | LK9 and LK10 Both "A" |
| Inverting | - INV | LK9 and LK10 Both "B" |

Table 8. Input polarity configuration
The input offset source is also configurable. When LK21 is in the " $A$ " position, the offset is derived from the on-board trim-pot R15, which is adjustable from zero to full-scale. The default configuration for LK21 is in " B " position where the offset voltage is derived from the front-panel potentiometer.

The standard offset voltage range is from zero volts to full-scale; however, for applications that require negative offset voltages, LK20 can be moved from the " $A$ " to " $B$ " position. In the " $B$ " position, the offset range is from -100 V to full-scale.

| Offset Configuration | Code | Link Positions |
| :---: | :--- | :--- |
| $\mathbf{0 V}$ to +200V Range (def.) |  | LK20 " A " Position |
| $\mathbf{- 1 0 0 V}$ to +200V Range | -OR2 | LK20 " B " Position |
| Front panel source (def.) |  | LK21 " B " Position |
| PCB trim-pot source | - OS2 | LK21 " $\mathrm{A}^{\prime}$ Position |

Table 9. Offset voltage source configuration

## 11 Gain

The standard voltage gain is $20 \mathrm{~V} / \mathrm{V}$. However, in the 100 Volt range, a gain of 10 may be more convenient. This can be achieved by removing LK14 and LK15. In this configuration, the voltage monitor sensitivity becomes $1 / 10 \mathrm{~V} / \mathrm{V}$.

## 12 Bridged Mode

In bridged mode, two amplifiers are connected in series to double the output voltage range and power. To obtain $\pm 200 \mathrm{~V}$ at the load, the amplifiers are configured as illustrated below. Both amplifiers are configured in the $\pm 100 \mathrm{~V}$ range and the lower amplifier is also inverting. $\mathrm{A} \pm 5 \mathrm{~V}$ signal applied to both inputs will develop $\pm 200 \mathrm{~V}$ at the output.

Figure 7. Bridged configuration for obtaining $+/-200 \mathrm{~V}$

## 13 Overload Protection

The Shutdown indicator will illuminate during a shutdown caused by a current overload or if the amplifier overheats as a result of excessive ambient temperature, poor air-flow, or fan failure. During shutdown, the amplifier output current is limited to a few mA and may float to the high or low voltage rail if the load impedance is high or capacitive.

When the amplifier is turned on, the overload protection circuit is engaged by default and will take approximately three seconds to reset.

In addition to the internal shutdown triggers, the output stage of the amplifier can also be disabled by applying a positive voltage to the external shutdown connector ( 2 V to +12 V ). The impedance of the external shutdown input is approximately $2.5 \mathrm{k} \Omega$.

## 14 Output Connection Diagram

The actuator can be connected to the amplifier by either two 4 mm banana plugs, a LEMO 00 coaxial connector, or a 2-way LEMO OB connector. The LEMO OB connector is recommended in high power applications. Preassembled LEMO cable assemblies are available from www.PiezoDrive.com

The mating plug for the LEMO OB connector is a 2-Way straight cable plug. Ordering details and specifications are listed below. These parts can be obtained directly from www.mouser.com.

\author{

}
*The crimp terminal plug requires a tool, if this is not available, the solder tag plug should be used.
A two conductor cable is required to connect the amplifier to a transducer. A recommended cable is the Belden 8451 cable. The specifications are listed below.

Cable Belden 8451
Conductor Size AWG22 ( 0.64 mm diameter)
Resistance $53 \mathrm{mOhms} / \mathrm{m}$
Capacitance $115 \mathrm{pF} / \mathrm{m}$ core-core, $220 \mathrm{pF} / \mathrm{m}$ core-shield
Outside Diameter 3.5 mm

The actuator wiring diagram is shown below.

### 14.1 LEMO OB Cable Preparation

(Taken from LEMO OB Series Cable Assembly Instructions)

| Solder |  |  | Crimp |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| L | S | T | L | S | T |
| 13.0 | 7 | 3.0 | 17.0 | 7 | 4.0 |

### 14.2 LEMO OB Plug Assembly

(Taken from LEMO OB Series Cable Assembly Instructions)

1. Strip the cable as above
2. If the cable is shielded, fold the shield back over the cable
3. Slide the strain relief, collet nut (1)
 and collet (3) onto the cable.
4. Solder or crimp the conductors onto the contacts.
5. Assemble the plug,

## 15 Enclosure

The PX200 enclosure has a side air intake and rear exhaust. These vents should not be obstructed. If sufficient air-flow is not available, the amplifier will enter a thermal overload state as discussed in "Overload Protection".

The PX200 amplifiers can be bolted together in a side-by-side two-channel arrangement. With the addition of rack-mount handles, this configuration can be mounted into a standard 19-inch rack. A 19-inch rackmount kit is also available for a single amplifier.

## 16 Warranty

PiezoDrive amplifiers are guaranteed for a period of 3 months. The warranty does not cover damage due to misuse or incorrect user configuration of the amplifier.
